

How strata are organized in the unpack database

Three levels of experimental organization

Each experiment unpack conducts is given a different experiment name, '1a1'. These can be nested within a meta.experiment name (such as '1' for the experiment above). In addition it is possible to specify a block within each experiment. This provides two levels of hierarchy in the experiments, though these levels might not always be treated the same.

```
map=unique(phenolong[,c("experiment","meta.experiment")])
map=map[map[,2]!="farm",]
plot(graph_from_data_frame(map))
```
